

- JSX:--javascript xml that's allow to write the html inside the java script.

# JSX

---

JavaScript XML (JSX) – Extension to the JavaScript language syntax.

Write XML-like code for elements and components.

JSX tags have a tag name, attributes, and children.

JSX is not a necessity to write React applications.

JSX makes your react code simpler and elegant.

JSX ultimately transpiles to pure JavaScript which is understood by the browsers.

```
1  import React from 'react';
2  import logo from './logo.svg';
3  import './App.css';
4  function App() {
5    return (
6      <div className="App">
7        <header className="App-header">
8          <img src={logo} className="App-logo" alt="logo" />
9          <h1>JSX With React</h1>
10         </header>
11       </div>
12     );
13   }
14
15   export default App;
16
```

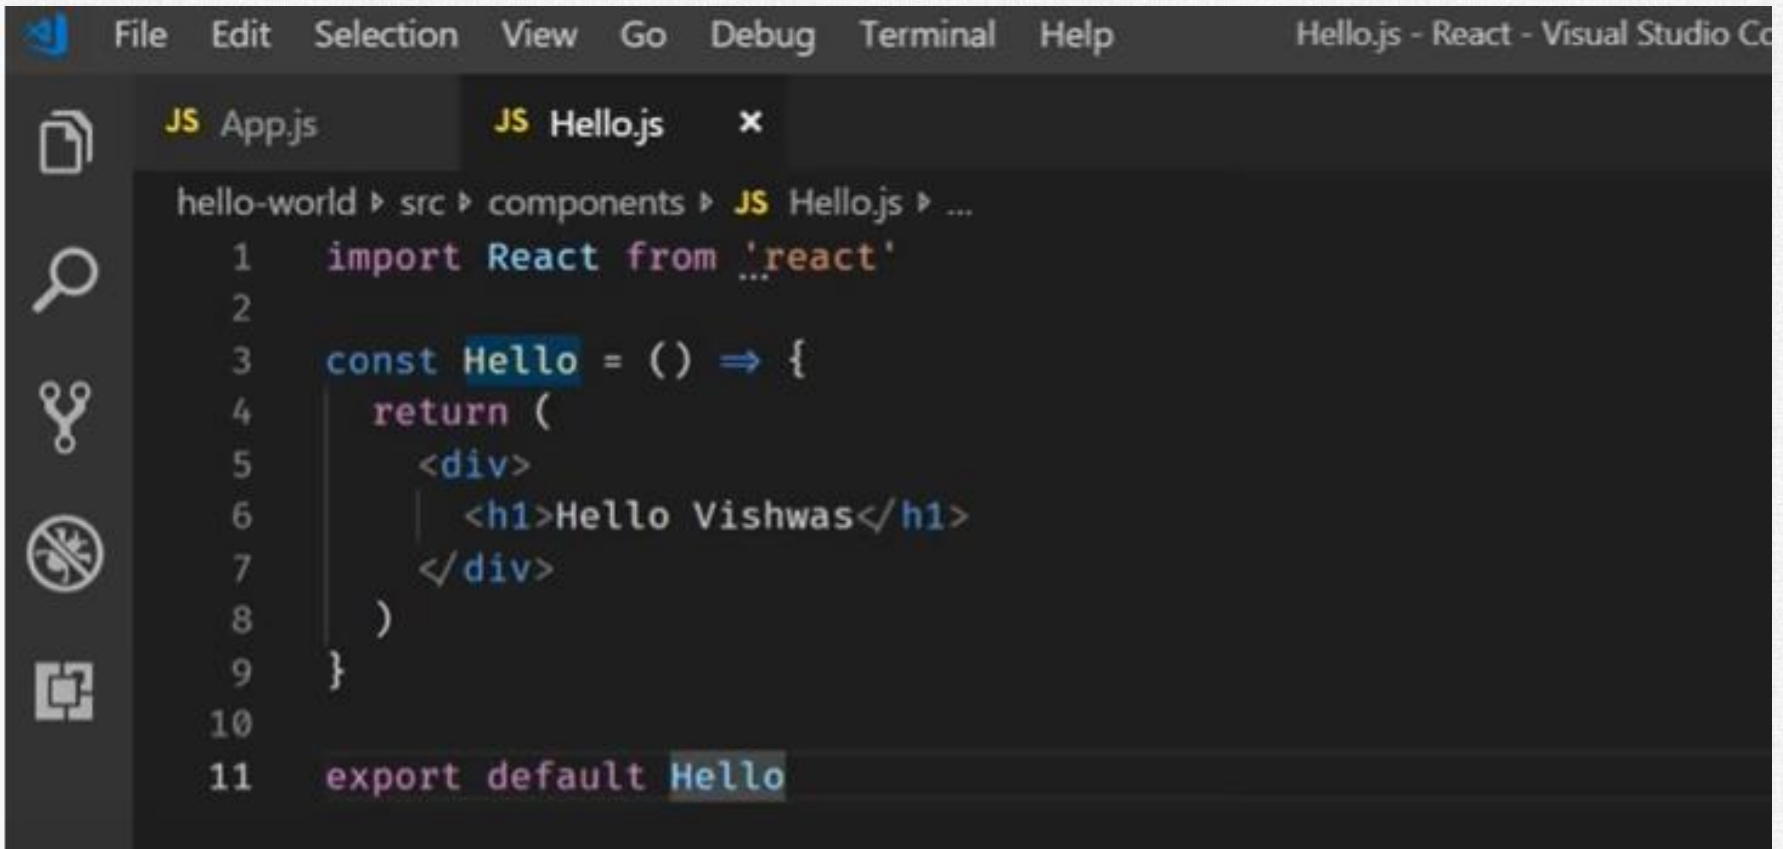

## **What's the difference between props and state in ReactJS?**

- While props and state both hold information relating to the component, they are used differently and should be kept separate. props contains the information set by the parent component (although defaults can be set) and should not be changed. state contains “private” information for the component to initialise, change]

# Create a file inside Component folder:-

- Hello.js:--jsx(javascript & xml) code we have to put inside that file

A screenshot of the Visual Studio Code editor interface. The top menu bar includes 'File', 'Edit', 'Selection', 'View', 'Go', 'Debug', 'Terminal', and 'Help'. The title bar shows 'Hello.js - React - Visual Studio Co'. The file explorer on the left shows a project structure with 'App.js' and 'Hello.js' files. The main editor area displays the code for 'Hello.js' with line numbers 1 through 11. The code is as follows:

```
1  import React from 'react'
2
3  const Hello = () => {
4    return (
5      <div>
6        <h1>Hello Vishwas</h1>
7      </div>
8    )
9  }
10
11  export default Hello
```
